Re-Skinning over a 2001 Co. Roof – Introduction

After a 2001 Co. roof has aged out and has protected the building as intended, the 2001 Co. System may need a new skin. 2001 Co. has a Re-Skinning technique that is cost effective and makes that 2001 Co. Wind Vented System like “Brand New.”

By using the existing membrane as the shear skirt, six inch (6”) seam tape is installed, two feet (2’) in from perimeter edges and penetrations. By also adhering the outer two feet (2’) with bonding adhesive and installing the proper terminations, the re-skinning membrane is installed very efficiently and cost effectively.

The original air seals, Equalizer Valves™, terminations, and flashings can be reused. 2001 Co. can warranty all new work and update the warranty when the flashings are installed at a later time.
